Geoengineering Projects That Could Offset Global Warming

ScienceDaily (Jan. 28, 2009) — The first comprehensive assessment of the climate cooling potential of different geoengineering schemes has been carried out by researchers at the University of East Anglia (UEA).

Geo-engineering is the large-scale engineering of the environment to combat the effects of climate change — in particular to counteract the effects of increased carbon dioxide in the atmosphere. A number of schemes have been suggested including nutrient fertilisation of the oceans, cloud seeding, sunshades in space, stratospheric aerosol injections, and ocean pipes. (Credit: iStockphoto)
