**“Officials say Neb. nuke plant is safe from flood”**

The Fort Calhoun nuclear power station in Fort Calhoun, Neb., currently shut down for refueling, is surrounded by flood waters from the Missouri River, Tuesday, June 14, 2011. On Tuesday, the releases at Gavins Point Dam in South Dakota hit the maximum planned amount of 150,000 cubic feet of water per second, which are expected to raise the Missouri River 5 to 7 feet above flood stage in most of Nebraska and Iowa.
