Abstract: A brief summary of our results is as follows. We find that, in the proton-boron colliding beam fusion reactor, the power which must be supplied to maintain an optimal colliding beam configuration is estimated to be as least 5.1 times greater than the fusion power.

This implies that effective power conversion

efficiencies to electrical power in excess of 84% will be required. Furthermore, if the transverse collisional spread of the proton beam is to be limited by electron drag, the boron density is constrained to have magnitudes will below the optimal value at which the fusion power is maximized.

Limitations: APPROVED FOR PUBLIC RELEASE
Description: Final rept. 15 Jun 1999-30 Nov 2000
Pages: 36
Report Date: 16 FEB 2000
Contract Number: N00014-99-1-0888
Report Number: A724783
