RE:   International Field campaign to Examine Impact of Beetle Kill on Rocky  
      Mountain Weather and Air Quality

Dear Media Relations:

This study is greatly needed, however, in case you are not aware, the study should begin with a study of the effects of the existing cloud creation spray program (weather modification) on vegetation that is altering the average weather on a global scale and its effects of increased vegetation stress and low resistance to fungus and beetle attack. This phenomenon occurs across the entire United States, Canada and Mexico.

Let me introduce myself. I am a retired Wildlife Manager Biologist with the California Department of Fish and Game with some 38+ years in the field. I am also a trained meteorologist with the US Air Force (1960-1964) and I am familiar with clouds and cloud creation programs.

I began following plant death in my fieldwork, and then started to notice it when I traveled. I have photo documented massive tree and shrub death across the United States and Canada, and it all looks the same. One area says bugs, the others say fungus, but no one is addressing the causes of the stress, assuming it is all global warming. Actually it is also solar burning when the IR and UV levels go above 12 or 13 when we get tip burn on the leaves. It looks just like freeze burn, and it promotes high levels of epicormal sprouting as well. But I consider this stage II.

I consider the weather modification program as Stage I, and believe it is responsible for many of the changes in our weather chaos and fluctuating conditions for plant growth, and which can alter the premises and results of your study.

I have been following this cloud creation program with some interest. I know what I am seeing, and when I tried to find out who was spraying and why, I hit dead ends. This only made me more curious. Observations with telescopes and binoculars indicated a large fleet of aircraft with no markings, either white or silver, mostly C-141 and KC-135 flying in military air space, turning their "contrails" on and off, with colors ranging from black to brown to white to silver. Who does the military allow in their air space? The aircraft are not the same as those described as part of the 85+ programs for bringing rain to the farmers, or for snow pack (just in California). They are also creating silver haze. The clouds are not formed by "contrails" but by spraying. Many have called the spraying "chemtrails" which really isn't too far off, and they are attacked as "conspiracy theorists." It's even more interesting that the government would use this term.

In September of 2007 I was invited to speak at the UN Conference on Global Warming in New York on this topic, and on natural microbial bioremediation of chemicals and toxins to reverse the trend. The flight from San Francisco to New York had a layer of haze 35,000 feet thick the entire distance ... I have never seen anything like it. Natural? I think not.

Review of the literature indicates that Dr. Edward Teller (of atomic bomb fame) proposed a solar shield over 30 years ago using weather modification principles with metal salts to provide a sunscreen for the earth. The proposal is now up for official consideration, but if adopted would really be an extension of the present program. Solar companies have reported losses of solar energy from 25 % to 35%.

In 1987, metal salts began to appear in every drinking water source in California and composed of aluminum, radium, boron, strontium, and other metals (California Drinking Water Records - the entire data base) where very few existed historically. The only way these metals could have occurred in this manner is through aerial application and groundwater absorption. When sprayed, they form clouds and drift to the ground and create the silver haze, both of which provide solar shading. The present program goes far beyond what we were doing in the 1960's and while they make incredible clouds, the fallout is toxic. It may also be nano-form.

The metal ions are also believed to be ionizing huge areas of lower atmosphere and are responsible for the huge and intense firestorms that many firefighters have commented about. I do not mean the usual effects from the lack of burning so common in our forests, but a fire intensity that far exceeds anything previous.

Your study really only covers stage II, the reciprocating effects of these species on the weather. If you were not aware of the former, your study would not have a complete background for the stage II examinations, and in fact would give mixed or wrong results. Are you aware of and looking at the cloud creation program? Are you doing soil and vegetation tests to determine base levels of these metals? Are you looking at other root causes and effects on existing conditions before you look at their reciprocating effects on the system? Are you looking at ionization and fire hazard increases? If not, I hope you seriously consider these concerns.

As government I learned not to trust government when you cannot get answers. It is difficult to distinguish between National Security and conspiracy in these conditions. I hope you are in this for the right reasons and I hope your study is fruitful. I hope my comments are helpful and that you have the bigger picture. I have and can get access to thousands of cloud creation pictures and vegetation death pictures if you want them.

Sincerely,

Allan Buckmann
