Learn about Jet Stream

[View Detailed Information »](#)

The Jet Stream map shows **today's high wind speed** levels and jetstream directions. Jet streams are fast flowing, relatively narrow air currents found in the atmosphere around 10 kilometers above the **surface of the Earth**. They form at the boundaries of adjacent air masses with significant differences in **temperature**, such as the polar region and the warmer air to the south. The jet stream is mainly found in the tropopause, at the transition between the troposphere (where **temperature** decreases with height) and the stratosphere (where **temperature** increases with height).
