Movento

[Overview](#)[Labels | MSDS](#)[Use & Mixing](#)[FAQs](#)[Ask Bayer](#)[Movento Survey](#)

Product Information

Movento™ is a revolutionary new insecticide with unique “2-way systemicity”, which distributes the active ingredient upwards and downwards in the plant to find and eliminate even hidden pests wherever they live and feed. Offering broad-spectrum control of many sucking pests, Movento will be an important addition to pest management programs in grapes, citrus, vegetables, tree fruits, tree nuts, Christmas trees and hops.

Movento utilizes a unique new active ingredient with a new mode of action, Lipid Biosynthesis Inhibitor (LBI), from a newer chemical class, the Tetramic acids. It is active by ingestion against immature insects feeding on treated plants. In addition, studies have also shown significant impact on exposed female adults by reducing fecundity and survival of offspring, providing more effective overall reduction in pest pressure.

NOTE: To maximize leaf uptake and systemicity of the active ingredient within treated plants, Movento must be tankmixed with a spray adjuvant having spreading and penetrating properties. Please contact your local Bayer CropScience representative or pest control adviser for specific recommendations by crop.

Key Benefits

Acropetal and basipetal (dual direction) systemic activity provides excellent pest control in dense crop canopies and on plant roots, as well as providing control of pests on twigs.

Lower spray volume can typically be utilized, resulting in time and labor savings, as well as more timely application to the entire area to be treated.

High level of residual efficacy and protection of new plant growth.
