Space Weather News for May 25, 2010
<http://spaceweather.com>

X-37B SIGHTINGS: Amateur satellite watchers have spotted a US Air Force space plane similar in appearance to NASA's space shuttle circling Earth in a heretofore secret orbit. Known as the "X-37B," it can be seen in the night sky shining about as brightly as the stars of the Big Dipper. Flyby predictions and more information may be found at <http://spaceweather.com> .

Would you like to turn your iPhone into an X-37B tracker? There's an app for that:
<http://simpleflybys.com> .

AURORA WATCH: A magnetic filament on the sun erupted yesterday (May 24th), and the blast hurled a coronal mass ejection in the general direction of Earth. High-latitude sky watchers should be alert for auroras around May 27th when the advancing cloud is likely to deal a glancing blow to our planet's magnetic field.
